National Science Foundation

Introduction

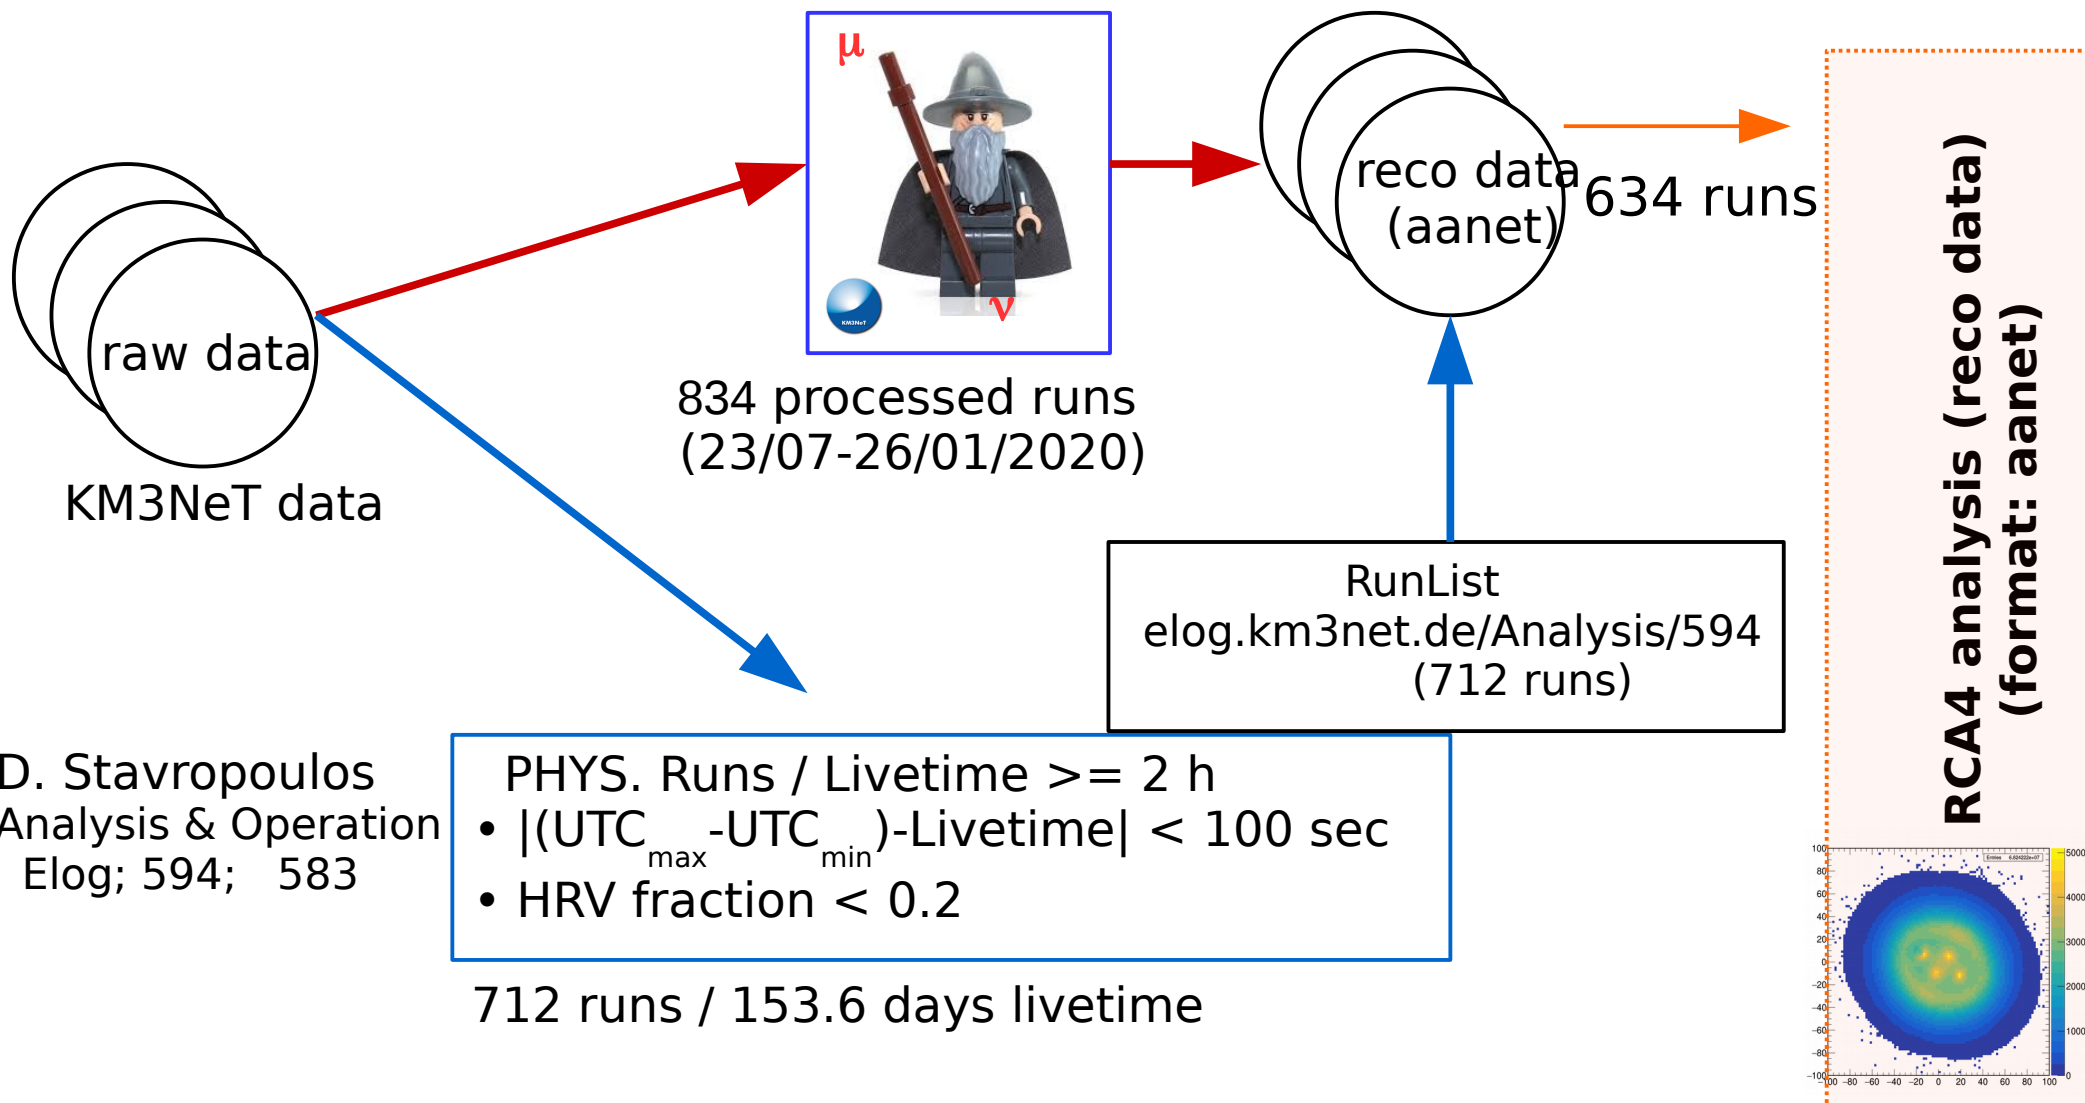

- **ORCA4: all data are processed → available at different levels, including Tier-2 computing@TSU**
- **ORCA4: <5% of the ORCA detector → a first multiline ($n_{\text{lines}} > 2$) configuration → possibility to check performance parameters**
- **ORCA4 performance → data/MC comparison**

In this presentation:

- ORCA4 data and MC
- Hit level comparisons
- Track level comparisons
- Long time events

Special thanks to Aart and Tamas for helping with analysis optimisation!

KM3NeT/ORCA4 Data

ORCA4 Data and MC Samples

ORCA4 processed data: 634 data files (aanet-format)

All processed/reconstructed events*: 83 634 895 (8.4×10^7 events)

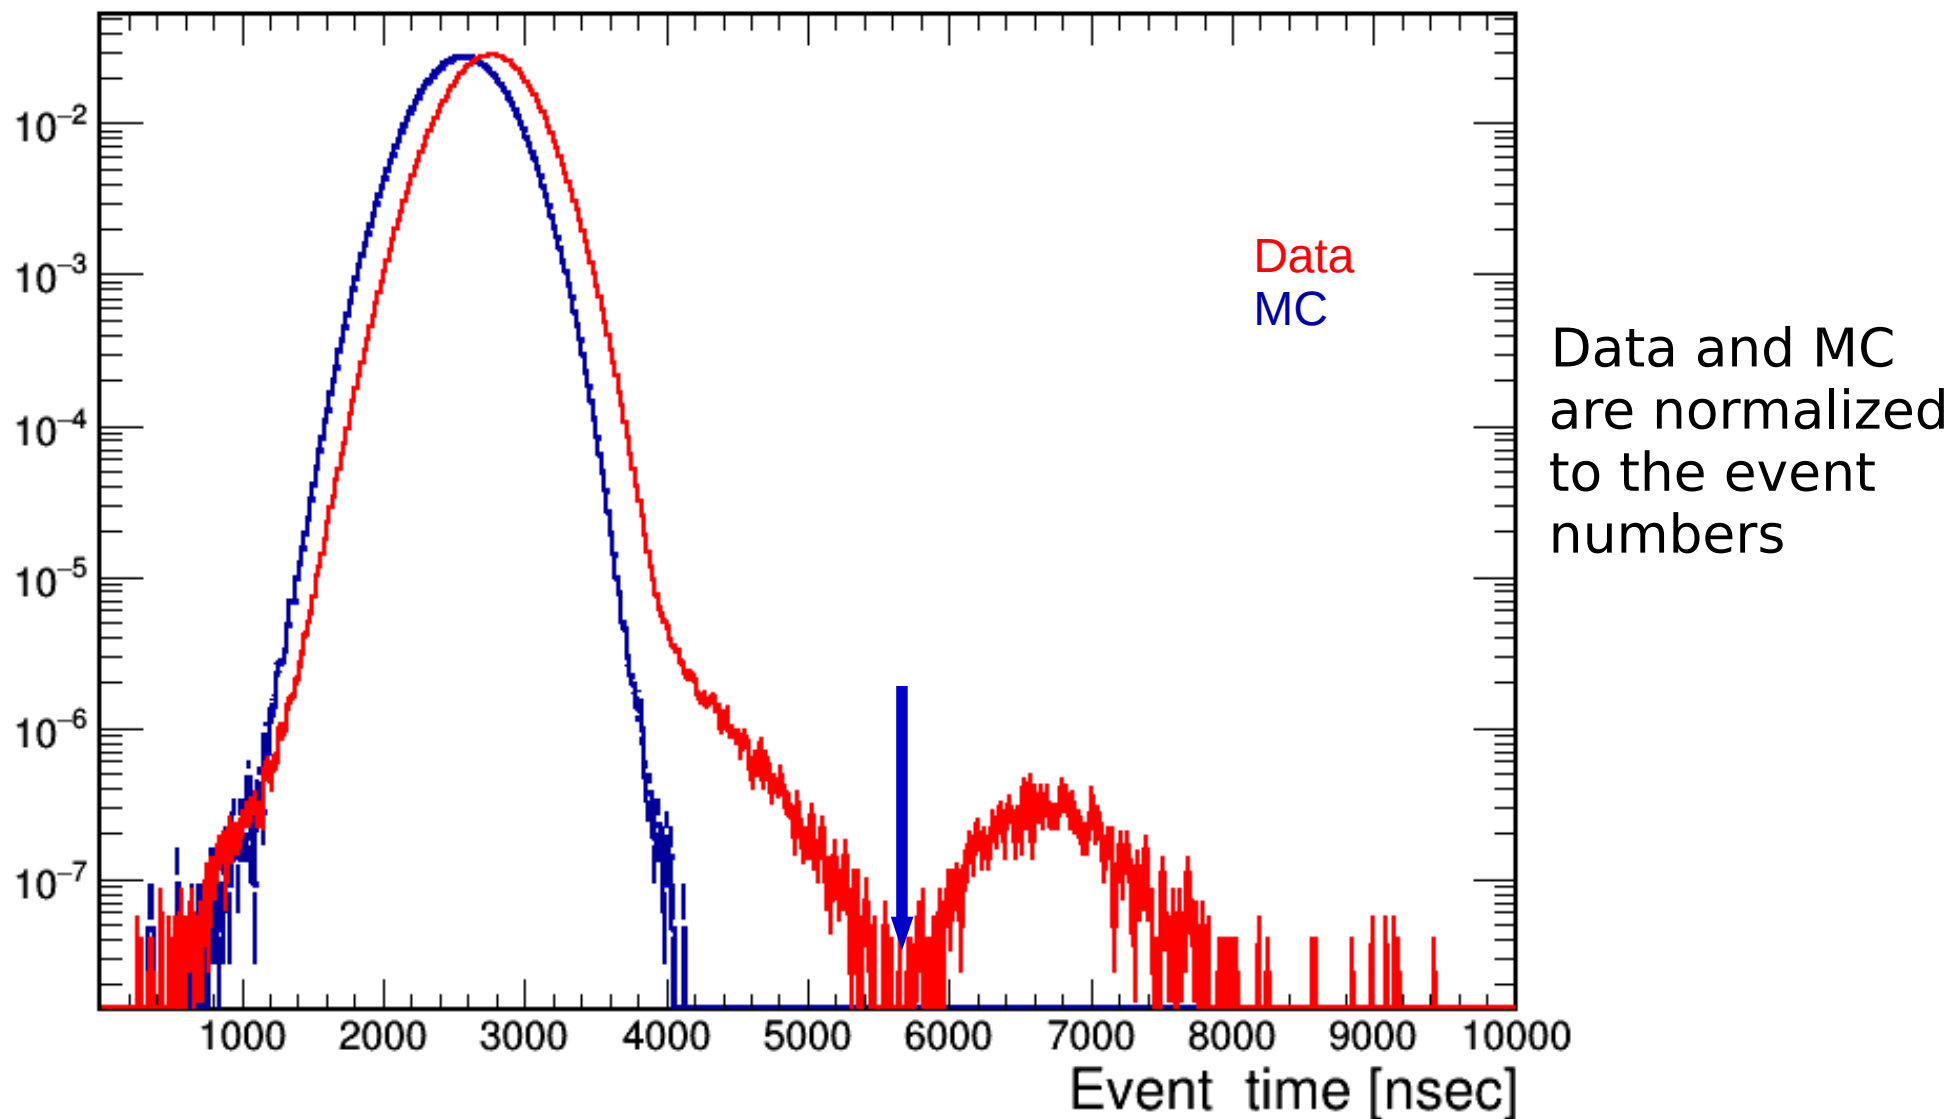

ORCA4 MC sample: rbr production: mupage → sirene → JORCAReconstruction

1436 files → 21 432 435 events ($\frac{1}{4}$ of data)

* <https://elog.km3net.de/Analysis/620>

ORCA4 Data/MC Comparison: Event Time

Events time: $\Delta t = (t_{\text{last}} - t_0)$ t-time of the hits

“Long time events“: $\Delta t > 5600$ nsec: 1429 (1.7×10^{-5} off data)

Triggered Hits

All Hits

Study at DOM
Is in progress

ORCA4 Reconstruction

ORCA4 reconstruction: currently only track like events

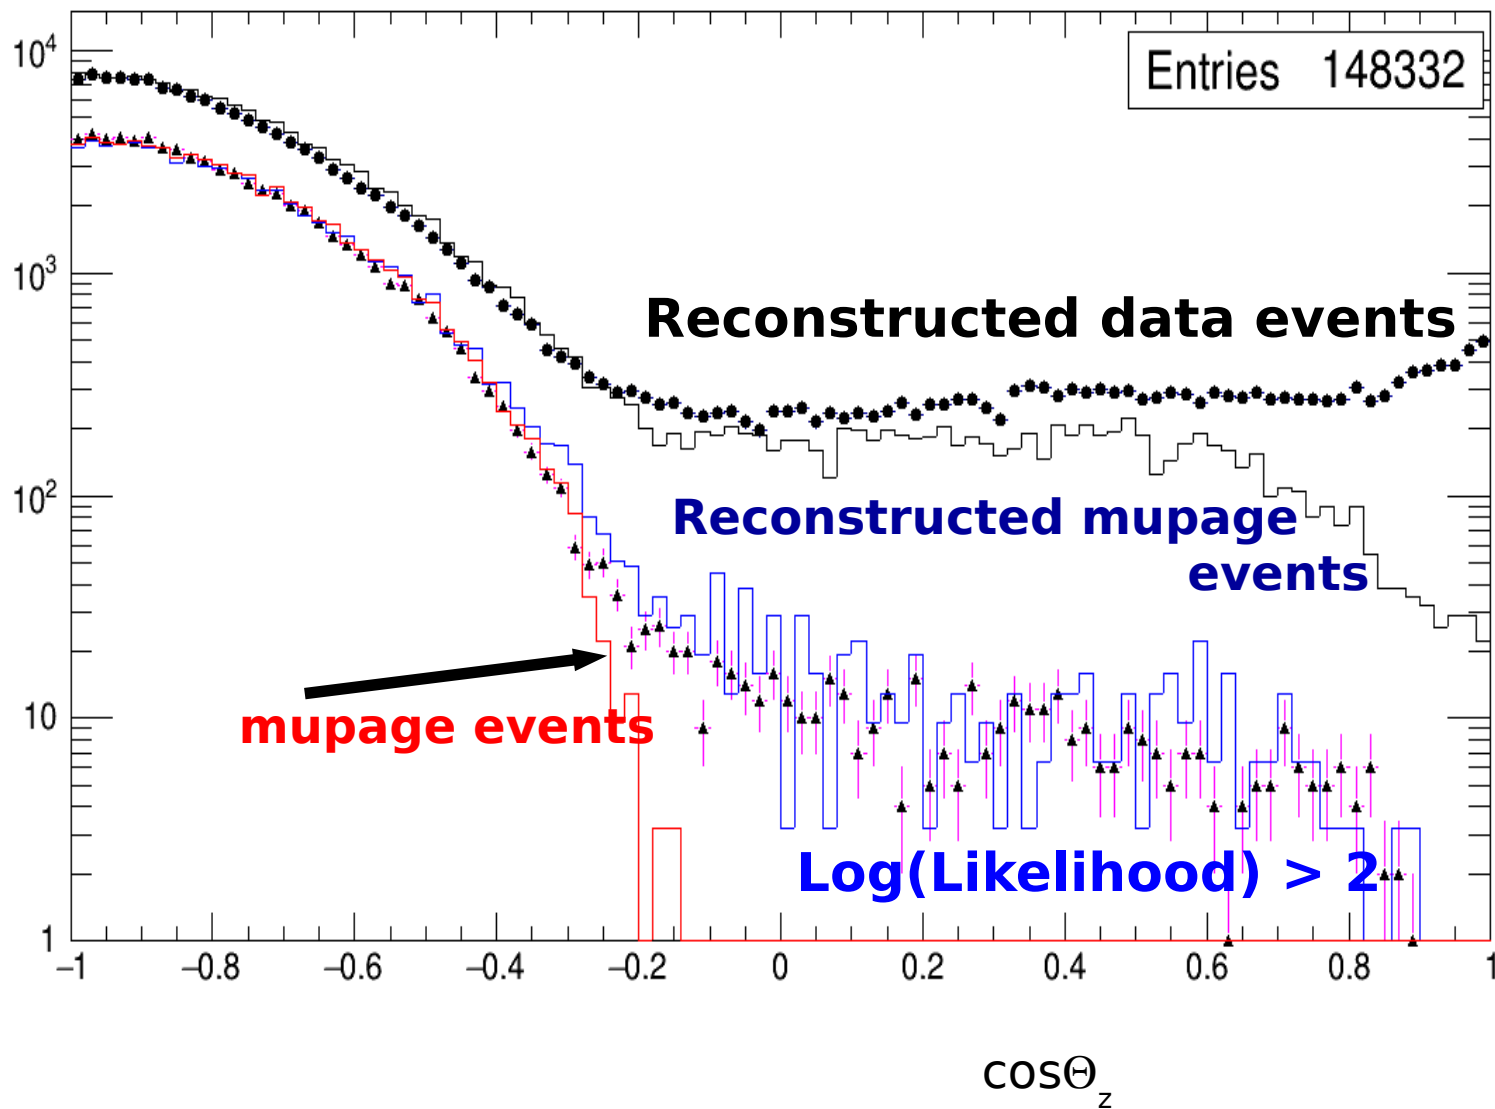

Reconstructed track:

- position: (x,y,z) ; unit vector of direction $(\cos x, \cos y, \cos z)$, t_0 : time

Reconstruction quality: L , fitinf (17 parameters)

KM3NeT/ORCA4 Data/MC: Reconstruction Quality

Comparison of data and atm- μ events

Example for run: 5886

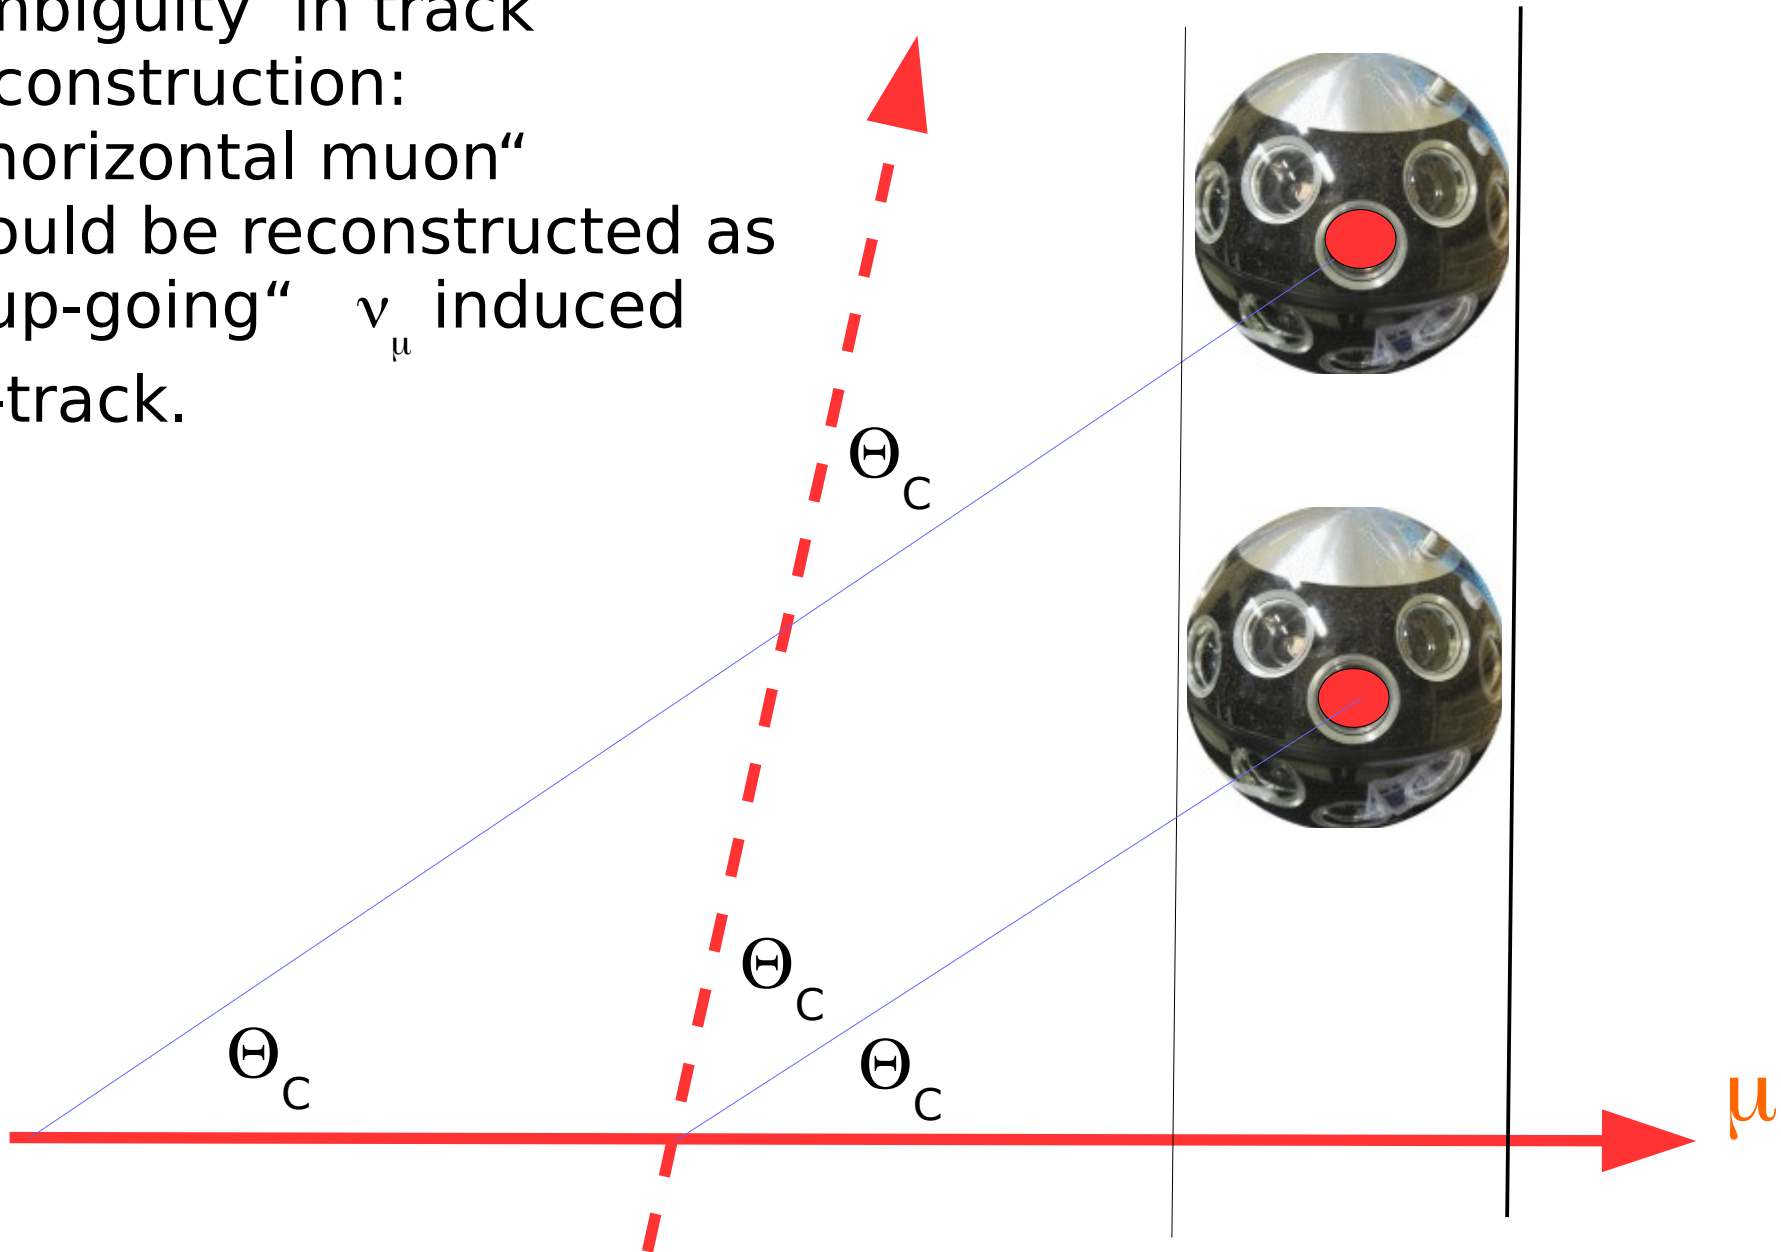

Atmospheric Muons: Angular Resolution

374 mupage-km3 files (rbr - background)
5 544 930 MC events

Reconstruction Ambiguity

Ambiguity in track reconstruction:
“horizontal muon”
could be reconstructed as
“up-going” ν_μ induced
 μ -track.

Angular Resolution

374 mupage-km3 files (rbr - background)
5 544 930 MC events

Long Time Event Display

z-t-Plot for DetID-44 (t0set: A02141094), Run 7056, FrameIndex 25247, TriggerCounter 1614, Overlays 997, Trigger: MX 3DM 3DS

Long Time Event Distribution

Reconstructed Track Parameters

Long Time Events' Track Parameters

Summary and Outlook

- All ORCA4 (first multi-line KM3NeT configuration) data is available for the analysis
- Data and MC are currently processed with “track like” events
- Data/MC comparison is made at different levels, some discrepancies found
- A small fraction of events (1.7×10^{-5}) have very long time → origin of these events are under the study
- Understanding of ORCA4 performance is a necessary condition for the next step: selection and analysis of neutrino events
